You can also leave feedback on our website: functional significance of hemodynamic factors in humans with heart disease by analyzing biomechanical data. For assessing cardiac function, the circulatory system should be represented as a hydrostatic system of which the pressure and volume are the crucial factors for regulation of cardiac output (CO). In this study, hemodynamic regulation of CO at rest and in response to a mild physical stress was investigated in the human, using a pressure-volume catheter to measure the hemodynamic variables. The mechanical behavior of the cardiovascular system was quantified as its time-course changes in pressure and volume associated with the blood flow. The catheter allowed us to perform the hemodynamic study on any heart, at any location of the body, and with very fine mesh scale resolution. As a result, we proved that there are two particular time-scales in the hemodynamic response to the external stress, and accordingly, that cardiac function can be represented as a steady-state process of the cardiovascular system, despite the highly non-linearity of the cardiovascular system. On Thursday, April 18, 2016, Governor Matt Bevin declared a state of emergency in response to the flooding in western Kentucky that caused widespread damage to property, businesses, and roads in Jackson, Clay, and Casey Counties. Governor Bevin also issued an emergency order prohibiting all travel on Interstate 75 between exits 113 and 116 in Kentucky. These locations are to the north of the area affected by the Kentucky River flooding. State and d41b202975
