The Photoshop file format Adobe Photoshop was designed as an industry standard of raster images. Images are composed of dots arranged in a grid. When you save an image, you create what's called a `_layer_` which is a special arrangement of these dots. On Windows, you create a layer file with the Photoshop application, and then you save the image to the file system. On the Macintosh, you create a document in the app. A document has several layers that you can add and remove. You can save documents as `.psd_` files on the Macintosh and as `.psd_` files on the Windows platform. On the Macintosh, the file format is rather simple. You do most of your file manipulations with the application, so you save files in the format you want (if you're using Photoshop Elements, you save files as `.psd_` files). You see the exact file format in Figure 9-1 in Photoshop. Photoshop Elements creates files in this file format. When you load a Photoshop file in the program, you see this information. Q: How to specify the names of public members of a query? I have three domains with name Point1, Point2 and Point3. I have their public members' values that are related to each other. For example, the points' values are longitude, longitude_1, longitude_2, latitude and latitude_1. Now, I want to build a query that shows the values of the points for the X value and the Y value of the point which is just connected with another point. This is what I'm trying to do: `SELECT *,(SELECT Points.longitude_2 - Points.longitude FROM Points WHERE Points.longitude=Point1_longitude_1 AND Points.longitude_1=Point1_longitude_2) AS delta FROM Point1 WHERE LONGITUDE = 0.0;` And I get the following error: #1064 - You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use near '(SELECT Points.longitude_2 - Points.longitude FROM Points WHERE Points.longitude=Point1_longitude_1 ' at line 4 Can someone help me?
