

The Photoshop interface is very intuitive. To begin working with the software, select one of the tools at the top of the screen by clicking with the mouse. Once the tool of your choice has been selected, you can click on the tools options to select the brush or the eraser. Once this is done, select a color or an image from the pull-down menus on the sides of the screen to place it in your image or on your canvas. Next, use the tools to paint or erase the areas of the image you wish to change. To change the brush size or opacity, simply zoom in and out with the zoom tool, or move the zoom extender to the right or left using the scroll wheel on your mouse. You can also adjust the size of the image to fit your canvas using the Crop tool. To change the color of the image or canvas, use the tool called the color picker.

For example, he rearranged an image of Bob Dylan with dozens of related images to form his cover image for a *Rolling Stone* cover story a few years back. I found that one of his images was nearly identical to another image that I used as a similar background. He simply edited one and applied the same edit to a duplicate, then replaced the originals. Once Photoshop has copied the background image and the image you want to be the new background, you have to go to Image>Adjustments>Duplicate and set the new copy to Overlay. Then you need to go to Image>Adjustments>Blending and use the color selection tool to select specific areas of the image to clone over the background. If you want to oversample, you'll need to set the duplication area to Large and the blend mode to Luminosity. Using custom templates is an easy way to create a professional look. The process calls for you to start with an image of the cover. Since Photoshop's default format is JPEG, you'll need to convert that to a TIFF or PSD file. One of my editors did most of the work for me, but we had to do it himself because I had a deadline. Unfortunately, he didn't know how to make a custom stock photo cover. When you're ready to start, select File>New>Paper... with the size and orientation set for the intended print. By the time you're done, you should have a working template for dozens of stock image print sizes that cover a wide range of likely paper sizes and paper types. The default templates are good, but they don't have you cover every image from an entire knowledge base. What my editor didn't do for me was to make a template for stock images of people. I specifically asked him to, but he said that the process for that was too much work.

Theoretically, any computer monitor can also display Pantone colors and possible even a Pantone swatch application, but right now that's not always possible.
