Adobe has released some new exciting features to improve the image editing experience. The first one to get my attention was the automatic exposure improvement. You would be surprised how much better the images will look when you adjust the exposure by selecting the spot inside the highlight and shadows. Compared to its competitors, Photoshop is still far behind when it comes to 3D, perspective warping, and so on. Cloning should obviate the need for plug-ins like Photoshop Cloner Pro, and no version of Photoshop should be without those plugins. Even removing the ability to clone parts of an image, Photoshop is still lacking in many ways, for example if the user wants to know the true polygon counts of the required objects in an image. Photoshop's UI is still somewhat obtrusive, and in some cases it is not that clear where to look for the most relevant setting. I'm happy to see that Adobe continues to demonstrate an interest in the desktop audience with their Windows software, even if it's in an unofficial form. Observing their work in 2014 has been a surprise, and I'm optimistic that innovation will continue in 2015. For those in the business of selling photography software, this is of the highest importance. For consumers, it's a matter of convenience. Followers of the Photoshop learning curve might want to choose a somewhat lighter version of the program instead. A \$59 upgrade to Elements will remove most if not all of the features found in Photoshop, except for the ones found in Elements' Feature Set 1. However, Elements comes at a much cheaper price point (\$59 is a lot less than \$700 for the full version of Photoshop). For the price of Elements, the Windows and Macintosh paths run the equivalent of Photoshop CS3 and CS4, respectively.

At the same time, the new Photoshop also has some exciting enhancements to its range of productivity features such as Content Aware Fill. This lets you fill in areas in your image that you can see, using content from the surrounding area - enabling you to work faster and more easily, as you're no longer limited to the confines of your selection. The new fill tool is also built to be smart. It can recognise the patterns of clothing, roll up a pattern over a selection and then fill in the gaps. This can be further enhanced using Adobe Sensei Sensei Core ML, which can predict the future, creating a new version of fill tool that predicts the next action to be performed. The new tool can also be set to tell other tools 'no, don't do that', if it predicts the result of an action might be bad. The new Content Aware Fill enhancements to Photoshop also include some exciting new pattern recognitions, such as patterns within materials and patterns of text applied to a person's face. This new version also has improvements to the way in which the tool handles complex backgrounds that don't follow a simple pattern, and the ability to create complex multi-pattern fills. The new Adobe Luminance HDR (high dynamic range) feature in Photoshop is another exciting new update. It's a significant update in terms of quality. Using it you can convert your raw camera data into a final image, and you can also fully automate exposure adjustment as well as remove unwanted shadows and highlights. The new feature combines both wide dynamic range and high-precision tone mapping to deliver the most realistic results.
